

The previous slot nut in steel, the nut 1 ESD and the previous system for nut placement and holding with a separate spring clip are being replaced.

## Nuts for retrofitting

The new nuts from mk are intended for later insertion in the profile slot if, for example, the profile abutting surface is already closed and the conventional nuts can no longer be inserted. In addition, they can also be used for profiles with polished slot that are only opened on the joint. The spring steel sheet fixed the nut, so that the assembly of attachment elements vertically is much easier.

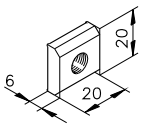

The ESD function ensures the conductivity of the connection.
